Playing with Proportions: Babies with Robot Limbs

I want to make a model like this to play with proportion. I stuck with a pretty standard body type with my most recent model and I really want to push form language to the limits with this coming project. I am experiencing pretty universal burn out in all my classes right now, so I just really want a project that I feel like I can engage with creatively— pushing the concept to limits, instead of myself for once. A model like this would let me have fun and use what I now know about Maya to make a character that strongly expressing the form language of age and body type of the character. Proportion is also a visual form I've been dabbling in and really want to push.

As a deliverable I am interested in rigging and animating my model. I think a model with these proportions (and just the contextual movement of how babies move and hold themselves) would have a really unique walk cycle and mannerisms. I'd love to conceptualize those. To that effect I'd like to make a video short portraying the model with audio to show character through design and mannerism.

Sketches and Ideas

Concept: Humanoid War Hog Inspired by WWI

- I wanted to take the outfits worn by soldiers during the First World War and make my own character that appeared to be a warhog in human clothing.
- Created a bust as well as a separate 3D rendered image.
- Had exactly two weeks to complete this second character.
- Untextured.

The course was pretty good, I learned a lot! I do think that some of the course work could be re-worked. We spent most of the semester on one model– maybe we could do more of an iterative process, like starting with a bust and then a full model? Overall though, I think that the course was pretty good!
